SUMMARY

Applied LLM evaluator and AI systems builder with a background in operations, technical troubleshooting, training, and high-accuracy process execution. Designs structured evaluations for AI systems with an emphasis on retrieval quality, evidence integrity, safe abstention, source authority, and reproducible findings. Brings years of experience working independently in accuracy-sensitive environments, training teams, reconciling discrepancies, and documenting technical issues—now applied to evaluating and improving AI systems.

EDUCATION

Mid-America Technology Center

Drafting & Architectural Design Certificate

2007–2009

Little Axe High School

High School Diploma

2005–2009

EXPERIENCE

Safety-Aware Retrieval Evaluation

Independent Project

- Designed and executed a 74-question evaluation benchmark testing whether a retrieval system could distinguish factual support, source authority, policy compatibility, conflicting information, and cases requiring abstention.
- Developed structured pass/fail and reconciliation criteria rather than relying solely on retrieval similarity scores.
- Identified errors in initial retrieval-outcome reporting during post-run analysis and corrected the interpretation.
- Withheld unsupported aggregate claims pending reconciliation rather than presenting uncertain results as verified findings.
- Documented methodology, limitations, corrected findings, and supporting evidence as a public portfolio case study.

Belief Lifecycle Engine

Independent Working Paper / Experimental Evaluation

- Designed a preliminary architecture for evaluating how long-lived AI agents should handle information that was previously valid but becomes outdated.
- Used deterministic simulation to compare controlled system behavior while preserving clearly defined reproducibility limits.
- Applied explicit evidence-status labeling—including preliminary and corrected findings—to prevent experimental results from being presented with greater certainty than the supporting evidence allowed.
- Documented the project as an evaluation of temporal reliability, stale information, and decision quality in persistent AI systems.

Shipping & Receiving Overnight Associate

2025–2026

Medline Industries, Inc.

Oklahoma City, OK

- Maintained 99%+ inventory accuracy across multiple corporate logistics systems while verifying shipments and reconciling discrepancies.
- Performed detailed overnight work independently in a high-volume, accuracy-sensitive environment with minimal supervision.
- Documented equipment-performance issues, inventory discrepancies, and corrective actions for supervisors.
- Followed strict operational, safety, and maintenance procedures while identifying issues requiring escalation.

Warehouse Associate / Crew Trainer

2024–2025

Hobby Lobby Corporate Headquarters

Oklahoma City, OK

- Selected to train incoming employees on workflow, process, equipment, and safety standards.
- Logged and processed inbound and outbound shipments using digital scanning and asset-tracking systems.
- Enforced inventory-labeling and data-entry requirements across daily warehouse workflows.
- Assisted shift supervisors with scheduling, workflow optimization, and resolution of operational issues.

Assistant Store Manager

2018–2024

Harps Food Stores, Inc.

Norman, OK

- Directed daily operations, inventory control, scheduling, and issue resolution for a staff of 40+ employees.
- Designed and delivered onboarding and training programs for new employees.
- Investigated and resolved complex operational and customer-service problems and reported outcomes to upper management.
- Coordinated staff, inventory, equipment, and workflow requirements in a fast-paced operating environment.

TECHNICAL SKILLS

LLM evaluation and AI quality assurance

Retrieval-system and grounding evaluation

Evaluation benchmark and rubric design

Safe-abstention and failure-case testing

Evidence reconciliation and claim verification

Structured output review and model-behavior analysis

Experimental documentation and reproducibility

AI safety and reliability analysis

Technical troubleshooting and root-cause investigation

Structured data and accuracy validation

Process documentation and workflow improvement

Independent technical research and testing

ADDITIONAL TECHNICAL BACKGROUND

Digital inventory, logistics, and asset-tracking systems Technical and operational troubleshooting Written issue reporting and process documentation Workflow optimization and staff training AutoCAD, Autodesk Inventor, 3DS Max, and Adobe Illustrator
